

ATTENDANT EQUIPMENT
101-TYPE KEY EQUIPMENT
METHOD OF OPERATION
701A, 701B, AND 740E PBX

1. GENERAL

1.01 This section covers the method of operating 101-type key equipment when used with auxiliary trunk SD-65725-01 arranged to function with attendant line SD-65725-01 or attendant trunk SD-65737-01. Information in this section is also intended for use in applying an overall operational test of connecting circuits.

1.02 This section is reissued to revise Table C to incorporate a steady audible signal to the attendant when a calling station disconnects and the attendant has failed to disconnect after completion or called party answer.

2. METHOD OF OPERATION

2.01 When overall operational tests of connecting circuits are made, PBX stations, test lines, test desks, etc, should be employed to establish the necessary conditions for tests.

2.02 The key unit is equipped with five 3-position locking trunk pickup keys, a nonlocking hold key, and optional buzzer and battery cutoff key. Each pickup key may pick up two trunks in the outside positions of the key, the center position being the release or normal position. The pickup keys are only released manually. Lower numbered keys cut off succeeding keys when operated. Incoming and outgoing supervisory signals are received on the trunk and line lamps, respectively. The trunk (hold) lamp is removed when attendant line is used.

2.03 Fig. 1 and 2 show the difference in equipment arrangements when an attendant trunk or an attendant line is used with an auxiliary trunk.
