PAGING TELEPHONE SERVICE

PAGING TELEPHONE SERVICE

...helps you get work done

faster!

Paging Telephone Service permits instant two-way communication with one or all employees within a department. This service is ideal for reaching file clerks, stock room personnel or other employees who move around a large area while working.

Now there's no need for an employee to answer the phone . . . lay it aside while getting facts for you . . . and return to the phone. Instead, you simply dial his Paging Telephone and he talks to you *from where he is!*

The Paging Telephone consists of a loudspeaker, microphone and a two-way electronic amplifier. Employees hear your voice through the speaker and reply through the microphone. Where normal background noise conditions exist, you can talk with a person located as far as 50 feet from the microphone.

When the Paging Telephone is called, the microphone and speaker are switched on by the same signals that ring the bell of a standard telephone. The amplifying unit is turned off at the end of each day. Knobs control loudspeaker volume and the input to the microphone. These controls can be set as desired.

HERE'S ALL YOU DO!

- 1 To get file information, you dial the number of the Paging Telephone in the filing department and ask for a clerk. Your voice is heard over the loudspeaker in that department. You talk to an individual—or to the entire filing force.
- 2 The file clerk faces the microphone and answers. When she finds the proper file, she tells you what you want to know. It's simple and quick—she's back to work in a moment!

Speed up stock room service!

Stock room personnel are in contact with people who rely on them—without wasting time and service by repeatedly rushing to answer the phone.

High-priced workers remain at work!

Now a man working under a vehicle or at a machine is not interrupted by a phone call. Questions are answered, directions given—*on the job!*

Paging Telephone Service

COMPLEMENTS THE WORLD'S FINEST BUSINESS TELEPHONE SYSTEM

Executives have long known P-A-X Business Telephone Systems as the most efficient, the most convenient and satisfying means of internal communication. Now with Paging Telephone Service, your P-A-X system becomes even more convenient and valuable.

Here's what you get—

The Paging Telephone system includes the compact two-way amplifying unit, the loudspeaker and the microphone. Although pre-set at installation, loudspeaker and microphone input controls may be manually adjusted. Normally, one additional microphone and loudspeaker may be jacked into the amplifier. The amplifier is equipped with a standard On/Off switch.

Any reasonable number of Paging Telephones may be added quickly and easily to any existing P-A-X system, or incorporated into a new installation, in much the same way that any conventional P-A-X telephone is installed. Wiring is simple. Four wires connect the amplifier to the P-A-X Control Unit; two wires run to the loudspeaker; a six-foot radio-type shielded cable runs to the microphone.

A wiring diagram is supplied with the amplifier. Installation, adjustments and maintenance may be handled by your own P-A-X maintenance people. Circuits and accessories are standard; replacement tubes for the amplifier are available from any radio parts dealer.

For additional information write for Technical Bulletin No. 559.
