

## B1/102 mini-network bracket

I used readily available 7/16" wide brass stock that was 1/32" thick. I feel this is the ideal width and thickness. You can purchase it from any hobby shop.

To bend, just place it squarely in a vise, and clamp it where you want the bend to occur, then bend it over using a hammer. Try to hit it as close to the vise as possible.

Be sure to drill your holes before bending!!
